MX Layer UMG Unified Mail Gateway

Powerful Email Security on Cloud and On-Site

MX Layer Unified Mail Gateway ensures the security of your email server in public and private cloud environments. You can easily activate UMG licenses for your email services running at your own cloud in your office or in your preferred cloud service provider. UMG instantly maximizes your email security.

MX Layer UMG is designed to work in all environments that require next level email security. You can receive MX Layer SaaS services from our public cloud or you can use it in your private cloud environment with on-site licensing. In line with the data regulation laws of your country where your business is located, it is possible to set up and run services on your local cloud. Multiple licensing models are available.

Spotlight on MX Layer Features

Manage Outbound Traffic At All Levels – Perfect Message Delivery

SPF, DKIM, DMARC and Outbound Thresholds. They are configurable with our control panel and you can create relevant DNS records inside. Just copy and use it. Check your DNS records and fix accordingly. Monitor outbound message counters and limit your users individually. Receive threat reports to your DMARC mailbox and visualize everything about your DMARC policy.

Protection at Gateway Level and After – Scan and Sanitize Anytime

UMG protects emails at the gateway level running latest methods and threat databases available. Malwares and urls that are not classified as threats may become dangerous later. UMG processes and proxies those links and files. Whenever those contents reached in the future UMG rescans them and classifies again. If it's found to be a threat content access is prohibited. Same content will be marked as threat and sealed for others on the UMG platform with notifying users about the incident.

More Than Just a Standart Mail Gateway

• User Access Proxy for protecting webmail and email client access via mail protocols like IMAP POP SMTP
• Built-in Archiving compatible with S3 Object Store and storage services like Amazon S3
• Business Continuity with Emergency Inbox Portal while your own mail service is down or unreachable
• Safely store and search all your logs with built-in discovery tool for email traffic and management
• Monitor and protect your mail traffic with external SIEM and SOAR Integrations with Rest API

Platform

Partnering with MX Layer

You can partner with MX Layer more than one way.

SaaS Solution Sales Partner

Licensing UMG to your customers through the MX Layer SaaS Platform is the fastest and easiest way of activating MX Layer partnership. You can start serving to your customers as a SaaS Solution Sales Partner immediately with zero investment cost.

PaaS Platform Partner

It is possible to create an Email Security Cloud of your own brand in order to provide services in accordance with the data policies of a certain geographical boundary with relevant borders. You will own the SaaS platform. Choose our MX Layer **PaaS Platform Partner** program to create this platform with special licensing types.

On-site License Sales Partner

MX Layer UMG **On-site License Sales Partner** program will be the right choice for the On-prem installations. Give service to your customers of certain sizes and whom are subject to strict data regulations.

MX Layer Partner programs are designed for your different needs. Let's discuss for registering the right program.

- User Based Multi Location Licenses
- Cpu Core Based Unlimited Licenses
- Installation and Platform Training Required

Email Security Made Easy

Multi-tenancy by Hierarchy

MX Layer is built on Multi-tenancy from day one. An operator runs the platform and It is possible to create more than one commercial brand. Each brand has unique characteristics and can run different business partner networks. Partners provision customers and support them with different service levels.

Customers are Organizations and each can be customized with different hostnames, visual themes and logos. Organizations can have multiple domain names with different or common administrators. Each domain name consist of email addresses. Users are basically email addresses and they are the last tenants of the platform.
